

ABSTRACT OF THE DISCLOSURE

The present invention is directed to a speech activated, speech operated, device for connection to an existing landline telephone with a one touch dialing feature, for hands-free automatic dialing. It includes a main housing, with a telephone control circuit to induce dialing of a telephone number, an encoder circuit connected to the telephone control circuit and a speech recognition module. The speech recognition module includes a processor for driving the other functions therein. The speech recognition module is connected to the encoder circuit and to a microphone and speaker for receiving speech input and transmitting audible and visible output, respectively. There is a power source connection connected to the telephone control circuit, the encoder circuit and the speech recognition module.
